1 Trading Strategy Description

A regression-type approach that directly calculates allocation from research level.

2 Rule Parameters

Below is a table summarizing the parameters specific to this trading rule.

| Parameter Name | Default Value | Description | Symbol |
|----------------------|---------------|----------------------------------|--------|
| Level Coefficient | 0.1 | Multiplier for regression. | k_1 |
| Constant Coefficient | 0.1 | Initial constant for regression. | k_2 |

3 Equation

Below are the equations which govern how this specific trading rule calculates a trading position.

$$z_t = k_1 * R_t + k_2 \quad (1)$$

with

z_t is the portfolio allocation at time t

R_t : Research value at time t

k_1 : level coefficient

k_2 : static coefficient

4 Glossary

- **Bullish:** Positive outlook on the market. Expectation of positive returns.
- **Bearish:** Negative outlook on the market. Expectation of negative returns.
- **Allocation:** The allocation is the fractional amount of the portfolios value used to determine the size of the trading position.
- **Parameter:** Value used by the trading rule in the calculation for trading position
- **Trading Rule:** Strategy to determine when to buy, hold or sell a position.
