Predictive Relationship: Exponential Trading Rule - One factor

Contents

1	Trading Strategy Description	2
2	Rule Parameters	2
3	Equation	2
4	Glossary	3

1 Trading Strategy Description

These representations have the position dependent on an exponentially weighted average of the prior values of research and price. The lookback length, L , determines how far back the rule looks. The decay rate, ϕ , and amplitude, κ , coefficients determine the contribution from each exponential. The expression is normalised to be dimensionless by division by the weighting factors and current price.

2 Rule Parameters

Below is a table summarizing the parameters specific to this trading rule.

Parameter Name	Default Value	Description	Symbol
Window size	10	This is the number of time steps over which exponential contributions are sourced.	L
Exponential decay rate for price	0.0	This is the decay factor for contributions from the price series.	ϕ^p
Exponential decay rate for research	0.0	This is the decay factor for contributions from the research series.	ϕ^r
Amplitude of price contribution	-0.1	This factor scales the overall contribution from past values of price.	κ^p
Amplitude of research contribution	0.1	This factor scales the overall contribution from past values of research.	κ^r

3 Equation

$$\lambda_n^p = e^{-\frac{n}{e-\phi^p}} \quad (1)$$

$$\lambda_n^r = e^{-\frac{n}{e-\phi^r}} \quad (2)$$

$$\Lambda_p = \kappa^p \frac{\sum_{n=0}^L p_{t-n} \lambda_n^p}{\sum_{n=0}^L \lambda_n^p} \quad (3)$$

$$\Lambda_r = \kappa^r \frac{\sum_{n=0}^L r_{t-n} \lambda_n^r}{\sum_{n=0}^L \lambda_n^r} \quad (4)$$

$$z_t = (\Lambda_p + \Lambda_r) / p_t \quad (5)$$

where p_t is the price at time t , r is the value of the research series, κ are the amplitude coefficients, ϕ are the decay rate coefficients and z is the resultant fractional portfolio investment.

4 Glossary

- **Bullish:** Positive outlook on the market. Expectation of positive returns.
- **Bearish:** Negative outlook on the market. Expectation of negative returns.
- **Allocation:** The allocation is the fractional amount of the portfolios value used to determine the size of the trading position.
- **Parameter:** Value used by the trading rule in the calculation for trading position
- **Trading Rule:** Strategy to determine when to buy, hold or sell a position.
