# 1 Rule Description

This trading rule computes portfolio allocation using the predicted price, standard error, and the Kelly Fraction. The price is predicted based on daily changes in the research series for a given number of prior time steps.

## 2 How to Trade

In order to trade with the rules InferTrade provides, we calculate allocations for each day. We then we allocate that percentage of our total portfolio value (cash + stocks) to the market we are trading - to do this we buy or sell stocks to reach the target allocation.

### How Allocation Determines Trade Size

The allocation is the fractional amount of the portfolios value used to determine the size of the trading position. For example, if the allocation for Microsoft (MSFT) shares is 50%, and we have \$100, we invest \$50 so that the value of held stock is the same as the value of held cash.

### Rule Specific Trading Details

Given default parameter values, if the asset drift is 0.01 and the error is 0.05 (5% daily volatility), this rule will take a  $0.01/(0.05)^2 = 4.0$  or 400% position (leveraged).

## 3 Rule Parameters

Below is a table summarizing the parameters specific to this trading rule.

Parameter Name	Default Value	Description	Symbol
Kelly fraction	1.0	Amplitude weighting. 1.0 is maximum growth if regression is exact. <1.0 scales down positions taken.	$F$
Regression length	50	This is the number of days used to estimate the regression coefficients.	$L$

## 4 Equation

Below are the equations which govern how this specific trading rule calculates a trading position.

$$y_t = \kappa \left( \frac{r_t}{r_{t-1}} - 1 \right) + c \quad (1)$$

$$z_t = F \frac{y_t}{E_y^2} \quad (2)$$

where  $r$  is the value of the research series,  $y_t$  is the predicted price at time  $t$ ,  $E$  is the standard error,  $F$  is the Kelly Fraction, and  $z$  is the resultant fractional portfolio investment.

## 5 Glossary

- **Bullish:** Positive outlook on the market. Expectation of positive returns.
- **Bearish:** Negative outlook on the market, Expectation of negative returns.
- **Allocation:** The allocation is the fractional amount of the portfolios value used to determine the size of the trading position.
- **Parameter:** Value used by the trading rule in the calculation for trading position
- **Trading Rule:** Strategy to determine when to buy, hold or sell a position.
